

MATH 181 2ND EXAM PRACTICE A

Spring 2019

NT		
Name:		

- Write your **full name** on the line above.
- Show your work. Incorrect answers with work can receive partial credit.
- Attempt every question; showing you understand the question earns some credit.
- If you run out of room for an answer, continue on the back of the page. Before doing so, write "see back" with a circle around it.
- You can use 1 page (front and back) of notes.
- You can use (and probably need) a calculator.
- You can use the Geogebra Scientific Calculator instead of a calculator. You need to put your phone on **airplane mode** and then within the application, start **exam mode**; you should see a green bar with a timer counting up.
- If a question is confusing or ambiguous, please ask for clarification; however, you will not be told how to answer the question.
- · Box your final answer.
- A formula sheet is attached to this test.

Do not write in this grade table.

Question:	Q1	Q2	Q3	Q4	Total
Points:	10	10	10	10	40
Score:					

Normal Distribution:

 $X \sim \mathcal{N}(\mu, \sigma)$

 $\mu = population mean$

 σ = population standard deviation

x =possible value of X

 ℓ = percentile of x (left area)

 $\Phi(z)$ = standard normal cumulative function

$$z = \frac{x - \mu}{\sigma}$$

$$P(X < x) = \Phi(z)$$

$$\ell = \Phi(z)$$

$$z = \Phi^{-1}(\ell)$$

Bernoulli Distribution:

 $X \sim \text{Bern}(p)$

X = 0 for fail or 1 for success

p = probability of success

$$P(X = 0) = 1 - p$$

$$P(X = 1) = p$$

$$\mu = p$$

$$\sigma = \sqrt{p(1 - p)}$$

Geometric Distribution:

 $X \sim \mathsf{Geo}(p)$

X = number of trials until first success

p =probability of success on each trial

n = a possible number of trials

$$P(X = n) = (1 - p)^{n-1}(p)$$

$$\mu = \frac{1}{p}$$

$$\sigma = \sqrt{\frac{1 - p}{p^2}}$$

Mean-Sampling Distribution:

 \bar{X} = sample mean

s =sample standard deviation

n =sample size

 $\mu = population mean$

 σ = population standard deviation

SE =standard error

$$SE = \frac{\sigma}{\sqrt{n}}$$

If $n \ge 30$ (or if population is normal) then:

$$\bar{X} \sim \mathcal{N}(\mu, SE)$$

Binomial Distribution:

 $X \sim \mathcal{B}(n, p)$

X = number of successes from n trials

p =probability of success on each trial

n = number of trials

k = a possible number of successes

$$P(X = k) = \binom{n}{k} p^k (1 - p)^{n - k}$$
$$\mu = np$$
$$\sigma = \sqrt{np(1 - p)}$$

If $np \ge 10$ and $n(1-p) \ge 10$, then

$$X \sim \mathcal{N}(\mu, \sigma)$$

Continuity correction:

$$P(X \le k) \approx \Phi\left(\frac{k + 0.5 - \mu}{\sigma}\right)$$

Confidence Interval:

CI =confidence interval

 γ = confidence level

 $\bar{x} = \text{sample mean}$

s =sample standard deviation

$$z^* = \Phi^{-1} \left(\frac{\gamma + 1}{2} \right)$$
$$SE \approx \frac{s}{\sqrt{n}}$$
$$CI = \bar{x} \pm z^* SE$$

Hypothesis testing:

 $H_0: \quad \mu = \mu_0$

 $H_A: \mu \neq \mu_0$

 \bar{x} = a possible/specific/observed sample mean

s =sample standard deviation

 α = significance level

$$\sigma \approx s$$

$$z = \frac{\bar{x} - \mu_0}{SE}$$

p-value =
$$P(|Z| > |z|)$$

= $2 \cdot \Phi(-|z|)$

If p-value $< \alpha$, then reject H_0 , else retain H_0 .

- **Q1**. (10 points) Brood XIV is a population of 17-year cicadas in eastern United States, including Massachusetts. The juvenile lifespan is normally distributed with mean of 16.8 years and standard deviation of 0.1 years.
 - (a) What is the probability of a random juvenile's lifespan being more than 16.7 years? In other words, let $X \sim \mathcal{N}(16.8, 0.1)$ and find P(X > 16.7).

(b) What is the IQR of juvenile lifespans?

Q2. (10 points) A 20-sided die (icosahedron) has a 5% chance of landing on each side. Imagine that only one side is a success and the rest are fails.(a) What is the chance the first success happens on the third roll?

(b) What is the chance of getting exactly 5 successes in 100 rolls?

(c) What is the chance of getting between at least 10 and less than 30 successes in 300 rolls?

- Q3. (10 points) You collect 45 measurements with a mean of 88.5 mm and a standard deviation of 11.0 mm.
 - (a) Determine a 90% confidence interval.

(b) Determine a 99% confidence interval.

(c) If a normally distributed population has a mean of 90 and a standard deviation of 11, what is the chance that 45 measurements will have a mean lower than 88.5?

Q4. (10 points) You had been told that adult elephants have a mean weight of 255 kg. You decided to measure the weights of 50 random elephants and run a hypothesis test with a significance level of 0.05.

Your sample has a mean of 249.8 kg and a standard deviation of 12.34 kg. What is your conclusion and why? Show your work for full credit.
